Windows Live Messenger (MSN) is an instant messaging software which will let you connect to your your friends, allowing you to send them messages even if they are offline.. Windows Messenger's user interface is devoid of the clutter seen in Winks, nudges, and custom emoticons are unavailable, and the main user interface more closely resembles the standard Windows XP style.

First of all, the app is very slow and somtimes it's not running When sending messages it sometimes doesnt send them and i have to turn it on again and try sending the messages again.. Interoperability with third-party software is exposed through a COM API called the Real Time Communications (RTC) Client API.. Later versions added 'ink' support and integration with (formerly Microsoft Office Communications Server).. It's actually very sad for me, because i can't see photos which the participants of the chat sent to each other, I can't make nicknames, change colors of chats, send or open some gifs, log in into messenger with another account and so on and so on.
